Test # 1: NewYear newsletter conversion

Newsletter subscribers exposed to two different newsletters.

Measure conversion: page view to view item

With a confidence level of 95% test aims to check if there is statistically significant difference between version 1 and version 2 of newsletter for conversion from page view to view item.

Crosstabulation

Campaign	Conversions	Non-conversions	Total Users	Conversions(expected)	Non-conversions(expected)	Conversion
NewYear_V1	2	44	46	2.967741935	43.03225806	4.35%
NewYear_V2	2	14	16	1.032258065	14.96774194	12.50%
Total	4	58	62			

From crosstabulation 2x2 table we can already see two possible problems: **sample ratios mismatch** and not met assumption for Pearson Chi-Square test - **2 cells (50.0%) have expected count less than 5**.

Before conducting Fisher's test let's check if sample ratios are statistically significant.

H₀: The actual ratios are not significantly different from the expected ratios (there is no mismatch)

Campaign	Observed Users	Expected Users	Expected Users (expected)
----------	----------------	----------------	---------------------------
